Barriers Related to the Evaluation and Follow-up of International Living Donors

Sponsoring Committee: Ad Hoc International Relations
Public Comment Period: January 21, 2025 – March 19, 2025

Executive Summary

The OPTN Ad Hoc International Relations Committee (the Committee) proposes a guidance document to share the Committee's assessment of common practices for evaluating and post-donation follow-up of international living donors, which include non-citizens/residents (NCR) and non-citizens/non-residents (NCNR). The Committee considers current literature and information provided through a feedback form to compile relevant practices that programs may consider as they evaluate NCR and NCNR candidates for donation and to provide post-donation follow-up. While international living donations represent a small percentage of total living donations,¹ the committee understands the unique challenges that programs face when assessing and caring for this donor population. By compiling relevant practices from current literature and feedback forms, the Committee aims to provide programs with an educational resource to consider as they navigate the complexities of evaluating NCR and NCNR candidates for donation. The guidance document will delve into practices and transplant program approaches for evaluating international donors, ensuring their physical and mental well-being throughout the donation process, and maintaining consistent post-donation follow-up care. This comprehensive guidance aims to assist transplant programs as they often face additional communication, logistical, and coercion barriers that can impact the donor's ability to participate in organ donation. By sharing its assessment and practices, the Committee hopes to empower programs to make informed decisions and provide support to this unique donor population, ultimately facilitating more successful international living donations and improving outcomes for all involved.

Background

OPTN *Policy 14: Living Donation* requires transplant programs to conduct a psychosocial and medical evaluation for all living donors before transplant donation. The evaluation process can be resource-intensive, as programs must obtain a significant amount of information to properly assess the donor's suitability. A study conducted by the American Society of Transplantation (AST) Living Donor Community of Practice workgroup identified several key issues that can arise when evaluating international donors, including problems with communication, complex logistics, and concerns about potential exploitation and coercion of the donor.² The AST workgroup also noted unique challenges in conducting post-donation follow-up care for donors who live abroad. To further explore these barriers, the Committee formed a workgroup with representatives from the OPTN Ethics and Living Donor Committees. A feedback questionnaire was sent to 205 living donor transplant programs, with 66 programs

¹ Ad Hoc International Relations Committee, OPTN, meeting summary for October 24, 2023, accessed December 2, 2024, https://optn.transplant.hrsa.gov/media/tfzjkbzs/20231024_ahirc_management-of-ild_summary.pdf.

² Shukhman, E., et al. "Evaluation and Care of International Living Kidney Donor Candidates: Strategies for Addressing Common Considerations & Challenges." *Clinical Transplant* 34, no. 3 (2020):e13792. doi: 10.1111/ctr.13792 <https://pmc.ncbi.nlm.nih.gov/articles/PMC8761064/>.

participating and providing 108 responses about the specific obstacles they face with NCR and NCNR potential living donors, including:

- Evaluation:
 - Communication barriers
 - Logistical barriers
 - Risk of exploitation, coercion, and inducement barriers
- Post-donation follow-up barriers

The key findings from this feedback are intended to provide an overview of current options that transplant programs can consider when assessing prospective living donors who do not reside in the United States, though the data gathered are not statistically significant. By illuminating these challenges, the OPTN workgroup aims to help transplant centers navigate the complex process of evaluating international living donors and facilitate more successful living donation outcomes.

Purpose

The purpose of this guidance document is to provide common practices and relevant literature for transplant programs to consider as resources for evaluating and managing international living donors.

Findings and Common Barriers

The barriers associated with the evaluation and care of international living donors include:

- Communication
- Logistics
- Risk of exploitation, coercion, and inducement
- Post-donation follow-up

Communication barriers

The communication challenges associated with the evaluation of international living donors include the method and the interpretation of information passed to the potential donor and responses to the transplant center.³ The process of assessing and approving an international donor is complex, requiring a clear and comprehensive exchange of information to ensure the donor fully understands the various elements involved. This can be complicated by differences in language, culture, and power dynamics between the medical staff and the donor candidate.

For example, a potential donor from a culture where it is considered impolite to refuse a request may be hesitant to truthfully express any reservations or concerns they have, fearing they will disappoint their family or friends. Similarly, differences in social class or the perception of clinicians as dominant authority figures can create barriers that inhibit open and honest communication. The use of interpreters, while necessary, adds another layer of complexity, as the interpreter must not only translate the words being spoken, but also act as a cultural broker to help bridge gaps in understanding.⁴

³ Ad Hoc International Relations Committee, OPTN, meeting summary for August 22, 2023, accessed December 8, 2024, https://optn.transplant.hrsa.gov/media/gr0bbjbf/20230822_ahirc_management-of-ild_summary.pdf.

⁴ Kaufert JM, Putsch RW. "Communication Through Interpreters in Healthcare: Ethical Dilemmas Arising from Differences in

Additionally, there are also challenges with understanding and interpreting the nuances and non-verbal cultural clues in communicating with potential donors.

Compounding these issues are the legal and privacy considerations that vary by country, requiring transplant programs to carefully navigate the appropriate means of initial contact and information sharing. Overcoming these challenges is critical to facilitating a successful donor evaluation process and ensuring the donor is fully informed to make the best decision for their circumstances.

To address these concerns, the Committee suggests using Health Insurance Portability and Accountability Act (HIPAA)-compliant secure communication to make initial contact with international donor-candidate and understand privacy laws in the candidate's home country.⁵ The Committee also suggests using trained medical interpreters to ensure accurate communication.⁶ It is also suggested to maintain transparency with donor candidates regarding any potential obligations that may be incurred prior to receiving donor consent, such as financial expenses.⁷

Logistic barriers

Evaluating potential living donors who reside outside the United States presents a unique set of logistical challenges that programs must carefully navigate. These international donors are a diverse group, hailing from various countries and backgrounds, each with their own unique circumstances and needs. A key issue is the significant geographic distance that often separates these donors from the transplant program, which can create major hurdles. For some, the program may be just a reasonable car ride away if they live near the U.S. border. However, for others, reaching the facility may require a lengthy flight spanning multiple time zones. This distance creates travel difficulties and expenses and can exacerbate the emotional and social stresses that living donors already face. Leaving their home, family, and support systems to undergo medical evaluations and procedures in an unfamiliar country adds considerable anxiety and disruption to the process.

There are also logistical complexities around obtaining necessary medical records, lab work, and other documentation from healthcare providers in the donor's home country. Ensuring seamless communication and coordination across borders is critical. Additionally, programs must be mindful that the financial assistance and insurance coverage available to living donors within the U.S. is often not extended to international donors, potentially creating an added financial burden.

To address these multifaceted challenges, programs are suggested to conduct as much of the preliminary donor evaluation as possible remotely. This includes initial screenings, lab tests, medical history reviews, and educational sessions - all of which can help determine a donor's suitability and minimize the risk of disqualification after they have traveled to the transplant center. Maintaining transparency about all potential costs is also essential.

Risk of exploitation, coercion, and inducement barriers

When evaluating international living donors, it is crucial to assess NCR/NCNR donor candidates for any evidence of exploitation, inducement, or coercion. This assessment is vital in determining the donor's true motivation for organ donation. It is currently required in OPTN *Policy 14* that all living donors be evaluated for this risk.⁸ Central to this assessment is determining the relationship between the donor candidate and the recipient.

Familial relationships, whether biological or emotional, often come with a sense of duty and cultural expectations that can weigh heavily on the decision to donate an organ. Family dynamics and the potential for coercion or undue pressure from family members must be carefully examined.⁹ For example, in some cultures, children may feel obligated to donate to a parent without question, or wives may be expected to defer to their husband's wishes, even if it goes against their own desires.¹⁰ On the other hand, unacquainted donor-recipient relationships, where no prior relationship exists, can be particularly concerning, as these individuals may be more susceptible to exploitation or inducement, such as through internet solicitations for living donors.¹¹

To address these concerns, the Committee suggests that donor candidates be assessed for risk of inducement, especially for vulnerable populations who may seek either asylum or financial remuneration.¹² Programs may refer to OPTN *Policy 14.2: Independent Living Donor Advocate (ILDA) Requirements* to evaluate and assess voluntariness of decision to donate.¹³ Furthermore, programs are encouraged to verify the relationship between the NCR/NCNR living donor candidate and the U.S. transplant candidate and explore any power concerns in the relationship.

Post-donation follow-up barriers

The post-donation follow-up challenges associated with evaluating international living donors are important social determinants of health that need to be addressed to improve healthcare equity and ensure the long-term health of NCNR donors. It is essential that the ability of a NCNR donor to obtain the necessary follow-up care in their home country is thoroughly evaluated and planned for during the pre-screening process. As the initial medical evaluation and pre-donation work-up begins, the framework for the crucial post-donation follow-up phase should be carefully mapped out. The AST Living Donor Community of Practice workgroup's publication by Shukhman et al. recommends creating a follow-up plan for care in the donor's home country prior to donation.¹⁴ This plan should address the

<https://pmc.ncbi.nlm.nih.gov/articles/PMC8761064/>.

donor's medical and psychosocial concerns and be documented in advance of donation, reflecting the donor's willingness to comply.

Given the challenges in adherence to follow-up recommendations of transplant programs and donors within the U.S., concern exists regarding the logistics of how NCNR and NCR donor follow-up will be completed. The OPTN requires that transplant centers report follow-up data which includes lab results, on living kidney donors at 6, 12, and 24 months post-donation. Oftentimes, the living donor is contacted by the program but then fails to complete the requested lab work. Often, the living donor is unable to be contacted after every effort of communication is exhausted, including telephone, email, and patient portals. Improving compliance with OPTN requirements for living kidney donor follow-up care supports an opportunity to expand telehealth and local healthcare partnerships and to improve pre- and post-organ donation care for living donors.

To address these concerns, the Committee suggests that programs develop a follow-up plan for care in the donors' home country prior to donation. This includes involving the donor's local physician in the planning of the follow-up care before donation. Programs should consider providing the donor with information for billing of any post-donation lab work back to the transplant center prior to the donor leaving the U.S. to return to their home country. Additionally, transplant programs could consider helping with travel costs for the donor to return to the program for complications related to donation or help pay for their care in their home county, if they are unable to travel back to the program.

Improving compliance with OPTN requirements for living kidney donor follow-up care supports an opportunity to expand telehealth and local healthcare partnerships, ultimately enhancing pre- and post-organ donation care for international living donors.

NOTA and Final Rule Analysis

The Committee submits this project under the authority of the Secretary's direction to the OPTN "to develop policies regarding living organ donors and living organ donor recipients, including policies for the equitable allocation of living donor organs."¹⁵ This project will promote patient access to transplants by offering guidance to transplant programs to consider when implementing practices of the evaluation and care of international living donors in the United States.

Projected Fiscal Impact to the OPTN

It is estimated that \$37,767 is needed for the development of this proposal. Development includes committee preparation and facilitation, proposal development, research and analysis, and presentations. It is estimated that \$4,825 would be needed to implement this proposal. Implementation would involve implementation communications and educational materials, updates to the OPTN website. It is estimated that \$0 will be needed for ongoing support. The total for development, implementation, and ongoing support is estimated to be \$42,593.¹⁶

¹⁵ Department of Health and Human Services, Health Resources and Services Administration, "Response to Solicitation on Organ Procurement and Transplantation Network Living Donor Guidelines," 71 Fed. Reg. 34946 No. 116 (June 16, 2006). <https://www.federalregister.gov/documents/2006/06/16/E6-9401/response-to-solicitation-on-organ-procurement-andtransplantation-network-optn-living-donor> (accessed June 23, 2020).

¹⁶ Resource estimates are calculated by the current contractor for that contractor to perform the work. Estimates are subject to change depending on a number of factors, including which OPTN contractor(s) will be performing the work, if the project is ultimately approved.

Conclusion

The Ad Hoc International Relations Committee recognizes the unique challenges faced by transplant programs when evaluating international living donors, including NCR and NCNR. These challenges can range from logistical hurdles in coordinating evaluations and follow-up care across borders to navigating complex cultural, linguistic, and socioeconomic factors that may impact donor suitability and long-term outcomes. To address these challenges, the Committee proposes a comprehensive guidance document that will serve as a resource for transplant programs. This document provides an assessment of current practices for evaluating and providing post-donation follow-up care to international living donors. By sharing insights and practices gleaned from the collective experience of transplant programs, the guidance document will empower programs to make well-informed decisions when considering international living donors.

Considerations for the Community

- Are there additional challenges that should be considered when evaluating international living donors?
- Are there additional strategies/practices that can be shared to address these barriers?

Guidance Document

1 OPTN Ad Hoc International Relations Committee Findings, Guidance on 2 Overcoming Barriers to Evaluation of International Living Donors

3 *Introduction*

4 The evaluation and care of international living organ donors, including non-U.S. citizens/residents (NCR)
5 and non-U.S. citizens/non-U.S. residents (NCNR), can pose unique challenges. Between January 2020
6 and June 2023, there was a total of 22,135 living donors. Of those, 692 (3.13%) were NCR, and 293
7 (1.32%) were NCNR.¹⁷ Access to living donors is limited and for some candidates, the only option for a
8 living donor transplant may be family or friends who are NCR or NCNR. While international living
9 donations account for a small portion of living donations, there is a need for scrutiny and attention to
10 the barriers that affect the selection and care of international donors. A 2017 American Society of
11 Transplantation (AST) Living Donor Community of Practice workgroup identified communication,
12 logistics, and assessment of coercion, exploitation, and inducement as barriers in evaluating
13 international living donors; the workgroup also identified unique challenges to international living donor
14 follow-up.¹⁸

15 The Organ Procurement Transplant Network (OPTN) Ad Hoc International Relations Committee (AHIRC)
16 provides this guidance document to explore these barriers further and share common practices that
17 transplant programs have used in evaluating international living donors and providing follow up. Some
18 of the findings in this document reflect certain inherent limitations: the findings are limited and
19 reflect self-selection by programs that chose to respond to the questionnaire on current practices;
20 responses reflect the transplant programs' point of view, not donor's; centers may have been guarded in
21 their responses, given the sensitivity of this subjects. Some of the responses may reflect duplicate
22 responses from multiple respondents at the same transplant programs. Overall, the survey findings
23 suggest options for transplant programs to consider, but are not statistically significant.
24 Achieving progress in reducing barriers requires sharing information on strategies to evaluate NCR and
25 NCNR candidates of donation. Since each transplant program's needs are different, this guidance should
26 be viewed as an educational resource for transplant programs to develop guidelines to evaluate and
27 care for international living donors.

28 *Background*

29 OPTN *Policy 14: Living Donation* requires transplant programs to conduct a psychosocial and medical
30 evaluation for all living donors before transplant donation. The evaluation process can be resource-
31 intensive, and obtaining the necessary information to evaluate the potential living donor can present
32 challenges, especially for international living donors. To explore the barriers transplant programs
33 encounter when evaluating NCR and NCNR potential living donors, the AHIRC formed a Workgroup with
34 representatives from the OPTN Ethics and Living Donor Committees. A questionnaire was sent to 205

¹⁷ Ad Hoc International Relations Committee, OPTN, meeting summary for October 10, 2023, accessed December 10, 2024, https://optn.transplant.hrsa.gov/media/tfzjkbzs/20231024_ahirc_management-of-ild_summary.pdf.

¹⁸ Shukhman, E., et al. "Evaluation and Care of International Living Kidney Donor Candidates: Strategies for Addressing Common Considerations & Challenges." *Clinical Transplant* 34, no. 3 (2020):e13792. doi: 10.1111/ctr.13792 <https://pmc.ncbi.nlm.nih.gov/articles/PMC8761064/>.

35 living donor transplant programs with 66 centers responding. The results include 108 individual
36 responses to questions about four specific barriers, which are reviewed in this document:

- 37 • Evaluation:
 - 38 ○ Communication barriers
 - 39 ○ Logistical barriers
 - 40 ○ Risk of exploitation, coercion, and inducement barriers
- 41 • Post-donation follow-up barriers

42 The Workgroup used key findings from program practices and program experiences of barriers to
43 evaluating NCR and NCNR potential living donors to provide an overview of current practices to suggest
44 options for transplant centers to consider in creating policies for potential NCNR and NCR living donors.
45 In developing the current resource, the Workgroup also considered an important resource in the AST
46 workgroup publication by Shukhman et al that encapsulated the summary and evaluation of the AST
47 effort.¹⁹

48 *Communication barriers*

49 The components of communication include the method and the interpretation of information passing to
50 the potential donor and responses to the transplant center. How this occurs may affect trust between
51 the potential donor and the transplant program. A study of professional medical interpreters
52 recommended that cultural competency training for physicians should make them more aware of
53 sources of misunderstanding and the difficulties in medical interpreting. It stressed the need for
54 physicians to know about the patient's country of origin and adapt to the patient's style of
55 communication.²⁰ There are significant challenges with understanding and interpreting the nuances and
56 non-verbal cultural clues in communicating with potential donors. Examples might be if the potential
57 donor felt it impolite to answer negatively for fear of disappointing or not having enough trust in the
58 caller to answer truthfully. Research in obtaining consent highlights some of the pitfalls that exist, even
59 with native language interpreters. Researchers conducting diabetes research in the Navajo nation used
60 interpreters and Navajo language consultants to translate the standard consent form, translating exactly
61 from English. Their early experience in recruiting subjects suggested that the consent process led to
62 embarrassment, confusion and misperceptions.²¹ Differences in class, culture, and power may also
63 impact communication barriers, with the clinician seen as the dominant player. The interpreter
64 potentially becomes an active participant given the need to explain and act as a cultural broker.²²

65 *Questionnaire Feedback*

66 The range of responses from the feedback questionnaire inform discussions about methods for
67 communication between transplant programs and donor candidates and the burden of responsibilities
68 on the donor.

- 69 • **Communication Methods:** In the questionnaire, most respondents reported favoring
70 conventional means for making first contact with potential donors by telephone or email. A few
71 centers relied on cell phone video apps, web based social media platforms, web-based video
72 conferencing. A couple of respondents made initial contact with web-based questionnaires.
73 Many programs indicated concern about maintaining confidentiality through their use of
74 encrypted email and/or HIPAA-compliant software. Most respondents used a trained medical
75 interpreter, rather than providing material to the potential donor in English and relying on the
76 potential donor to translate or run material through a machine learning translation program.
- 77 • **Access to records:** Most programs relied on the donor to send medical records. Eight programs
78 said they communicated directly with the potential donor’s local healthcare provider; three
79 programs said they asked the potential donor to allow them to access the patient’s electronic
80 medical record (EMR) portal. Three programs tried all methods, depending on circumstances.
81 Over half of respondents said they were not conducting telehealth follow-up visits with donors.
82 Centers conducting telehealth visits indicated the use of a variety of methods: telephone, web-
83 based video conferencing, email, or cell phone video apps.
- 84 • **Donor understanding of financial implications:** Whether programs rely on the donor candidate
85 to pay for international travel and lodging varies according to feedback received. Ensuring that
86 donor candidates understand what costs they may incur is therefore an important question.
- 87 • **Appropriate resources:** When asked whether their transplant programs have access to the
88 linguistically and culturally appropriate resources to support NCR/NCNR, most respondents
89 stated that they did (46 of 57). However, two respondents indicated that they did not, and nine
90 responded that they were not sure.

91 **AHIRC Findings and Common Program Practices**

92 Transplant programs should consider the following common strategies that were reported:

- 93 • Using Health Insurance Portability and Accountability Act (HIPAA)-compliant secure
94 communication to make initial contact with international donor-candidate and understand
95 privacy laws in candidate’s home country²³
- 96 • Using trained medical interpreters to ensure accurate communication²⁴
- 97 • Being clear with donor candidates about the potential financial costs that may be incurred prior
98 to receiving donor consent²⁵

99 *Logistical barriers*

100 This section focuses on the logistical barriers to be considered for evaluating international potential
101 living donors and following international donors who have donated and are living abroad. The primary

²³ Office of Ethics, Risks, and Compliance Services, [Oercs.berkeley.edu](https://oercs.berkeley.edu). (Accessed December 11, 2024)
<https://oercs.berkeley.edu/privacy/international-privacy-laws>.

²⁴ Juckett G, Unger K. “Appropriate Use of Medical Interpreters”. *AM Fam Physician*. 2014; 90, no.7:476-480
<https://www.aafp.org/pubs/afp/issues/2014/1001/p476.html>.

²⁵ OPTN. *Guidance for the Informed Consent of Living Donors*. (Accessed December 10, 2024)
<https://optn.transplant.hrsa.gov/professionals/by-topic/guidance/guidance-for-the-informed-consent-of-living-donors/>.

102 logistical barriers identified are travel, financial, obtaining medical records and labs from overseas, and
103 donor follow up.

104 International donors living outside of the U.S. are a heterogeneous group who may have emotional and
105 social challenges involved with travel, visas and health outcomes. For example, the distance from the
106 home of an NCR or NCNR living donor to the program is a major factor logistically. For potential living
107 donors who live near U.S. borders, programs may be within a reasonable car ride, while other potential
108 international living donors must take long plane trips to visit the transplant center.

109 *Questionnaire Feedback*

- 110 • **Visa application:** The questionnaire results indicated that most donor centers reported they
111 wrote a letter supporting the visa application to the U.S. Embassy in the potential donor's home
112 country. About a third of respondents indicated that the program left it up to the potential
113 recipient to make certain the donor candidate could legally enter the U.S.
- 114 • **Travel:** Programs take varied approaches as to when to bring potential donors to the U.S. A few
115 only brought the potential donor to the program when the donor candidate completed the
116 workup, while a couple programs brought potential donors in as soon as they expressed interest
117 and had them complete the entire workup at the program. About a third of respondents said
118 they brought the potential donor for in-person evaluation once the person had completed lab
119 work on blood type, tissue typing, donor specific antibody, and it was clear the pair were a
120 match, while over 40% said they waited for the donor-candidate to complete basic lab work to
121 bring them to the program but brought the potential donor in for higher level testing such as a
122 CT scan and tissue typing. In the event the pair were not a histocyte leukocyte antigen match or
123 the recipient had donor specific antibodies to the potential donor, discovered after the potential
124 donor arrived in the U.S., just under 39% of programs reported they entered the pair in the
125 OPTN Kidney Paired exchange program or the National Kidney Registry. Almost 30% said at that
126 point they cancelled the transplant, and the donor candidate returned home. 28% said they
127 looked for an internal paired exchange; one center said it looked for a compatible recipient on
128 their wait list. One program said it could go ahead with transplant after desensitizing the
129 intended recipient. It is essential that programs be clear that even following the early evaluation
130 and travel to the U.S., it is not guaranteed that the individual will be approved to donate or to
131 donate directly to the intended recipient.
- 132 • **Lab results:** Beyond the complexities of bringing potential donors to the U.S., programs use
133 various means to obtain lab results from abroad. Almost 73% reported that the potential donor
134 was responsible for sending lab results, 14% of centers relied on a hospital to send the results,
135 and 18% indicated that a physician was responsible for sending the lab results.
- 136 • **Financial considerations:** With respect to financial barriers, most survey respondents reported
137 that the donor was responsible for the costs while only a few respondents indicated that the
138 recipient's insurance covered these costs. Additional reported sources of funding included
139 GoFundMe²⁶ or other fundraising campaigns, as well as seeking support from Donor Shield²⁷,
140 the potential donor's home country embassy, or foundations or grants or family.

²⁶ GoFundMe. (Accessed December 17, 2024)
<https://www.gofundme.com/>

²⁷ Donor Shield. (Accessed December 17, 2024)
<https://www.donorshield.com/>

- 141 • **Legal status:** Most respondents (84 %) stated they accept non-US citizens residing in the US with
 142 some legal protection, while a smaller but still substantial proportion (61%) indicated their
 143 programs accepted non-US citizens in the US without legal protection as potential donors.
 144 Around three-quarters of responding programs stated that the recipients' legal status had no
 145 impact on the non-citizen's donor candidacy. The questionnaire further queried respondents as
 146 to the level of legal status which were required to be a living donor, with 64% indicating that
 147 they do not require any level of legal status. Of the remaining respondents, 32% required a
 148 green card/legal permanent residence; 27% required a long-term visa; 16% accepted deferred
 149 action or temporary protected status; 7% accepted asylees awaiting hearing status; and 7%
 150 required a social security number. More than half of respondents indicated that barriers existed
 151 related to donors' concerns regarding their legal statuses.

152 **AHRC Findings and Common Program Practices**

153 Transplant programs should consider the following common strategies that were reported:

- 154 • Programs may determine if a potential donor holds a visa for legal entry to U.S. If not, the
 155 programs could advise the donor to begin application for B-2 visa (a tourism visa). Some
 156 programs supplied letters of support to further facilitate the process.
- 157 • Centers should consider how much of the work-up potential donors must have completed
 158 before travel to the U.S., it is advantageous to have completed as much of the early evaluation
 159 as possible, such as initial screening, blood work, medical history, required cancer screenings,
 160 education, and discussions to assess that the living donor is voluntarily willing to donate as
 161 detailed in a separate section of this document. These assessments assist in determining if the
 162 candidate is suitable for additional evaluation and can help reduce the possibility of being
 163 disqualified following travel to the program. Consider when the donor should travel to the
 164 transplant program. For labs required prior to travel, determine how these will be ordered and
 165 received. Programs should also consider what approach to take if they find donor candidate and
 166 recipient are not an HLA match after the donor arrives in the US.
- 167 • Of special importance prior to international travel is the discussion of financial considerations.
 168 Beyond the challenges faced by all living donors, such as time off from work for recovery,
 169 international living donors may incur substantial costs for obtaining a visa, international travel,
 170 housing in the U.S., transportation within the U.S., and required medical testing. Programs
 171 should provide full transparency regarding costs, especially as financial support that is available
 172 for living donor (LD) in the U.S. is often not available for international living donors. For
 173 instance, the recipient's insurance might not cover international lab work, and the living donor
 174 may not qualify for funding from the National Living Donor Assistance Center(NLDAC)²⁸ as
 175 NLDAC requires that both the recipient and donor be U.S. citizens or U.S. residents. Consider the
 176 estimated total costs and share information with donor. Early conversations with the program's
 177 financial manager should make fully clear to the potential donor the costs that may be incurred.
 178 Programs should consider whether funding by the potential recipient represents an inducement
 179 to donation, an issue discussed in the following section.
- 180 • Programs also found success in educating potential donors and having conversations with them
 181 about any concerns associated with their NCR or NCNR status.

²⁸ National Living Donor Assistance Center. (Accessed December 17, 2024)
<https://www.livingdonorassistance.org/>

182 *Risk of exploitation, coercion, and inducement barriers*

183 The Shukhman article²⁹ described the “risk of exploitation/inducement” as follows:

- 184 • Power and resource differentials between international donor candidates and U.S. recipients are
185 common.
- 186 • Donor candidates may have limited resources, limited access to medical care, and may be at risk
187 of pursuing donation in the hopes of remuneration or migration opportunities.

188 The definition of three critical terms helps to ground this discussion. Exploit means “to make use of
189 meanly or unfairly for one's own advantage.”³⁰ Induce means “to move by persuasion or influence.”³¹
190 Coerce means “to compel to an act or choice”; “to achieve by force or threat.”³² Ultimately, the intent is
191 to *detect and prevent* any coercion or inducement that would exploit a potential living donor.
192 Assessing the NCR/NCNR donor candidate for evidence of exploitation, inducement, or coercion is
193 important in determining their motivation for donating an organ. It is currently required in OPTN Policy
194 14 that all living donors be evaluated for this risk.³³ Central to this assessment is determining the
195 relationship between the donor candidate and the recipient and is required to evaluate potential
196 international donors for Human Trafficking for Organ Donation (HTOD).³⁴ The donor candidate-recipient
197 relationship can have an influence on the donor’s motivation for donating an organ. Broadly these
198 relationships are either: familial (biologically) or emotionally related; or unacquainted with no pre-
199 existing relationship between the donor candidate and recipient.

200 Duties and obligations associated with family relationships often weigh heavily on the decision to
201 donate, as do emotional bonds within the family and cultural familial influences. Attention should be
202 given to family systems and dynamics, and assessment for the presence of coercion, undue pressure, or
203 financial motivation³⁵. For example, if the relationship is familial, cultural norms might place undue
204 influence on the donor candidate, such as children expected to donate unquestionably to a parent or
205 wives expected to defer unquestionably to husbands.³⁶

<https://pubmed.ncbi.nlm.nih.gov/31356577/>.

³⁶ Ibid.

206 Unacquainted donor candidate-recipient relationships can be difficult to assess as to their motivations
 207 to donate. This group may be vulnerable to being exploited or coerced.³⁷ An example are the concerns
 208 regarding solicitations for a living donor on the internet.³⁸

209 In addition to donor candidate-recipient relationship, the socio-economic status of the donor candidate
 210 may influence their motivation to donate. For example, considering whether the donor candidate is a
 211 fully enfranchised resident of his or her home country. Another example would be if they are vulnerable
 212 class of persons such as a refugee, a persecuted religious or ethnic minority, or a socially disvalued
 213 person.³⁹

214 Donor candidates that come from resource-poor areas may be at a higher risk of being
 215 exploited/induced. This group may also be at risk to be inadequately informed or giving manipulated
 216 consent.⁴⁰

217 Given the potential nature of the power and resource differentials between NCR/NCNR donor
 218 candidates and U.S. citizen recipients, it is essential that transplant programs take particular care in
 219 assessing motivation for donation. As indicated by transplant programs themselves, this involves
 220 deliberately assessing the potential for coercion.

221 *Questionnaire Feedback:*

- 222 • **Voluntariness:** Six respondents identified concerns about coercion and local situations after
 223 communication. Three respondents couldn't verify the relationship, and two respondents
 224 identified power concerns in the relationship. A smaller number of respondents mentioned
 225 issues like third-party completed questionnaires and tried to control communication,
 226 recipient alluded to payment beyond travel and accommodation, or visa issues.
 227 Respondents indicated a need for additional support and resources to ensure the voluntariness
 228 of the donor candidate. These included interpreters (28%), an Independent Living Donor
 229 Advocate (ILDA) (14%), and in some cases, more in-depth evaluation, psychiatric assessment, or
 230 ethics review. However, 39% of respondents said they did not require any extra resources and
 231 relied on their standard protocols. *Note that respondents were able to select more than one*
 232 *concern, so answers are not mutually exclusive.* Most centers found it equally challenging to
 233 assess voluntariness and understanding of the process for non-citizen non-residents of the U.S.
 234 and non-citizens residing in the U.S. Notably, about a third of respondents said they did not
 235 proceed with transplants due to concerns about voluntariness. While many programs used an
 236 outside agent to assess voluntariness, several centers relied on the ILDA, as required by *OPTN*
 237 *Policy 14.2:Independent Living Donor Advocate (ILDA) Requirements*, which mandates the

<https://pmc.ncbi.nlm.nih.gov/articles/PMC8761064/>.

⁴⁰ National Academy of Science, "Advanced Research Instrumentation and Facilities". Washington, DC: The National Academies Press. <https://doi.org/10.17226/11520>.

<https://nap.nationalacademies.org/catalog/11520/advanced-research-instrumentation-and-facilities>.

238 involvement of the ILDA to evaluate voluntariness, regardless of whether the transplant
 239 program conducts the assessment itself or uses a professional in the donor's home country.
 240 • **Motivation:** 16% of respondents shared reasons that contributed to the decision not to proceed
 241 with a transplant involving an NCR/NCNR living donor as motivational concerns (e.g., coercion,
 242 payment, means to come to U.S.). A quarter of respondents used local psychologists or social
 243 workers to evaluate motives. Some respondents relied on the potential donor to affirm
 244 voluntariness. A small proportion of programs relied on the ILDA. Several programs said they
 245 conducted interviews in person to establish voluntariness, with one program stressing that the
 246 potential donor was alone when questioned about voluntariness.

247 Additionally, several questions looked at differences in communication between NCR and NCNR.
 248 Almost 55% of respondents said assessing the two groups for voluntariness was equally difficult.
 249 63% of respondents said it was equally difficult to make certain patients in either group
 250 understood the risks of donation. Of the centers that said they considered potential living
 251 donors who were non-citizen resident or non-citizen non-resident, but did not carry out the
 252 transplant, 31% cited concerns over voluntariness.
 253 • **Assessing coercion:** Respondents shared ways in which they would discern non-verbal clues of
 254 coercion or ask in a culturally sensitive manner: native language interpreter on video call, relying
 255 on local psychologist/social worker to evaluate and provide written report, or relying on
 256 potential donor to affirm they are not being coerced.

257 **AHIRC Findings and Common Program Practices**

258 Transplant programs should consider the following common strategies that were reported:

- 259 • It is important that donor candidates be assessed for risk of inducement especially for
 260 vulnerable populations who may seek either asylum or financial remuneration.⁴¹
- 261 • Comply with OPTN *Policy 14.2: Independent Living Donor Advocate (ILDA) Requirements* in the
 262 process of evaluating and assessing voluntariness of decision to donate⁴²
- 263 • Cases where recipient candidates pay for transportation and lodging costs, or evidence of any
 264 other monetary or non-monetary compensation, require additional scrutiny for coercion.
- 265 • NCNR donor candidates residing in the United States may be the only available living donors for
 266 family and friends who have also migrated to the U.S. These potential donors must be
 267 subjected to the same scrutiny applied to all living donors to assure there is no coercion
 268 involved in the decision to donate, and that the donor procedure is safe and will not impair the
 269 donor's long-term health.
- 270 • Some programs found success with having the independent living donor advocate (ILDA)
 271 discuss voluntariness alone with the potential donor.
- 272 • Verify the relationship between the NCR/NCNR living donor candidate and the U.S. citizen
 273 transplant candidate, and explore any power concerns in the relationship.
- 274 • Programs should apply multiple methods, relying on the expertise of culturally relevant
 275 resources, to ensure that coercion is not in play.

⁴¹ Shukhman, E., et al. "Evaluation and Care of International Living Kidney Donor Candidates: Strategies for Addressing Common Considerations & Challenges." *Clinical Transplant* 34, no. 3 (2020):e13792. doi: 10.1111/ctr.13792
<https://pmc.ncbi.nlm.nih.gov/articles/PMC8761064/>.

⁴² OPTN. Guidance for the Informed Consent of Living Donors. (Accessed December 10, 2024)
<https://optn.transplant.hrsa.gov/professionals/by-topic/guidance/guidance-for-the-informed-consent-of-living-donors/>.

276 Transplant programs should consider whether these approaches would be effective or appropriate for
277 their review of donor candidates.

278 *Post-donation donor follow-up barriers*

279 NCNR donors face unique barriers that US citizens do not in the organ donation process. These barriers
280 represent important social determinants of health that need to be addressed to improve healthcare
281 equity and ensure the long-term health of NCNR donors. Ideally, the ability of a NCNR to obtain follow-
282 up should be established during the donor pre-screening phase. As the pre-donation work up is initiated,
283 the groundwork for the follow-up phase should be planned. If the living donor can successfully complete
284 the initial lab work in their county and communicate with the living donor coordinator in a timely
285 fashion, then follow-up post-donation may not be an issue.⁴³ The article by Shukhman et. al
286 recommends creating a follow-up plan for care in the donor's home country prior to donation.⁴⁴ This
287 plan should address the donor's medical and psychosocial concerns and be documented in advance of
288 donation reflecting the donor's willingness to comply. The donor's local physician should be involved in
289 the planning of the follow-up care prior to donation.

290 Given the challenges in adherence to follow-up recommendations of transplant programs and donors
291 within the U.S., concern exists regarding the logistics of how NCNR and NCR donor follow-up will be
292 completed. The OPTN requires that transplant centers report follow-up data, including lab results, on
293 living kidney donors (LKD) at 6, 12 and 24 months post-donation. Despite this requirement, almost half
294 of all U.S. transplant programs are not in compliance with this requirement for all living donors.⁴⁵
295 Follow-up rates for NCR theoretically should be no different than for U.S. citizens, since they are living in
296 this country. Many times, the living donor is contacted by the program but then fails to complete the
297 requested lab work. Often, the living donor is unable to be contacted after every effort of
298 communication is exhausted, including telephone, email, and patient portals. Improving compliance
299 with OPTN requirements for living kidney donor follow up care supports an opportunity to expand
300 telehealth and local healthcare partnerships and to improve pre and post organ donation care for living
301 donors.

302 *Questionnaire Feedback:*

303 Feedback questionnaire results indicated that most of respondents agreed or strongly agreed that
304 access to healthcare after donation for donation-related complications is a barrier when evaluating non-
305 citizen residents without any or some legal protections. This was an especially strong barrier for non-US
306 citizens without any legal protection and was reported to be a barrier for 79% of respondents in this
307 category.

- 308 • **Follow up data:** The questionnaire results indicated that 43% of transplant program
309 respondents reported that the follow-up rate of international living donors as somewhat lower,
310 and 24% was much lower compared to U.S. living donors. Programs reported experiencing
311 challenges with obtaining follow up for OPTN required lab reporting for 56% of NCR and 79% of

⁴³ Lentine, K., et al. "Care of International Living Kidney Donor Candidates in the United States: A Survey of Contemporary Experience, Practice, and Challenges." *Clinical Transplantation* 34, no. 11 (2020):e14064. doi: 10.1111/ctr.14064
<https://doi.org/10.1111/ctr.14064>.

⁴⁴ Shukhman, E., et al. "Evaluation and Care of International Living Kidney Donor Candidates: Strategies for Addressing Common Considerations & Challenges." *Clinical Transplant* 34, no. 3 (2020):e13792. doi: 10.1111/ctr.13792
<https://pmc.ncbi.nlm.nih.gov/articles/PMC8761064/>.

⁴⁵ Orandi, BJ, et al. "Donor Reported Barriers to Living Kidney Donor Follow up." *Clinical Transplantation* 36, no. 3 (2022):e14621. doi: 10.1111/ctr.14621
<https://pubmed.ncbi.nlm.nih.gov/35184328/>.

312 NCNR living donors. The responding programs overwhelmingly report email as the preferred
 313 mode of providing lab orders to international living donors at 70%. Where the donors obtain the
 314 lab work is evenly split between a local hospital, local lab, or their primary care physician, with
 315 the donor owning responsibility of sending the results to the program in 73% of the responses.
 316 Findings showed that programs expect the donor to cover the cost of the follow-up lab work
 317 rather than covering the expense through the center, while a few still try to cover the cost with
 318 the recipient's insurance.

- 319 • **Telehealth:** 57% of the responding programs indicated that they do not conduct a telehealth
 320 follow-up. Thus, a NCNR may be required to travel from another country for a 10-minute
 321 appointment. If the trip back to the U.S. for the follow-up is the responsibility of the donor,
 322 most will not return. Of the centers performing telehealth follow-up visits, the majority are
 323 conducted via telephone or web-based video conferencing. This questionnaire of
 324 communication has its own challenges due to time differences and in many cases the need for
 325 translators. These challenges in NCNR follow up care may lead to missed complications related
 326 to the organ donation for the NCNR or a delay in diagnosis and subsequent care.
- 327 • **Communication methods:** The responding transplant programs report email as the most widely
 328 used form of contact between NCNR living kidney donors and the center due to time
 329 differences between countries at a rate of 84%. Although LKD complication risks are relatively
 330 low, identifying them early is key to preventing progression. Without proper follow-up post
 331 donation, complications such as hypertension, decreased kidney function, hernia, organ failure,
 332 depression, anxiety, and even death could be missed.⁴⁶ In the event of donor complications,
 333 68% of programs report they are willing to assist the donor with obtaining a visa to return to
 334 the U.S., if necessary, but the cost is the donor's responsibility according to 59% of programs.
- 335 • **Post-transplant considerations:** About half of centers indicated the donor would remain in the
 336 U.S. for follow-up for as long as it took the donor to recover whereas others used specified
 337 durations: 33% for one month, 16% for two months and 5% for three months. Once the donor
 338 has returned home, more than half reported not conducting telehealth visits with donors; of
 339 those doing follow-ups, most used the telephone, followed by video conferencing, email, or cell
 340 phone video apps. In the event of a post-operative complication after returning home, 68%
 341 reported helping the donor to get a visa to return to the U.S., but again held the donor (59%) or
 342 the recipient (44%) responsible for travel related to donor complications.

343 **AHRC Findings and Common Program Practices**

344 Transplant programs should consider the following common strategies that were reported:

- 345 • Develop a follow up plan for care in donors home country prior to donation.
- 346 • Involve the donor's local physician in the planning of the follow-up care before donation.
- 347 • Consider providing the donor with information for billing of any post-donation lab work back to
 348 the transplant center prior to the donor leaving the U.S. to return to their home country.
- 349 • Transplant programs could consider helping with travel costs for the donor to return to the
 350 center for complications related to donation or help pay for their care in their home county, if

⁴⁶ Hartsock JA, Helft PR. "International Travel for Living Donor Kidney Donation: A Proposal for Focused Screening of Vulnerable Groups". *Transplantation*. 2019 Dec; 103(12):2576-2581. doi: 10.1097/TP.0000000000002875. PMID: 31356577. <https://pubmed.ncbi.nlm.nih.gov/31356577/>.

351 they are unable to travel back to the center. Of course, any acute or life-threatening issue
352 should be addressed locally.

353 **Conclusion**

354 NCR and NCNR potential living donors are vulnerable populations facing unique barriers that require an
355 integrated and thoughtful approach to both evaluation and donor follow up. Transplant programs
356 should consider the options adopted by their peers for integration into their own effective practices for
357 their individual candidates.
